## Kogan' s attitude scale pdf

Volume 46, Issue 1, January 2009, Pages 38-44 Gerontological Nursing Education View Full Text Volume 90, September-October 2020, 104159 Attitude Towards Old People See Full Text OPEN ACCESS January 11, The 2016 Abstract This Critical Synthesis Package includes: (1) critical analysis of psychometric characteristics and application of health science education, Kogan's attitudes to old people on the scale (Kogan OP Scale), and 2) a copy of Kogan OP Scale and its scoring guidelines developed by Nathan Kogan, PhD. Kogan OP Scale 34-entry self-report scale designed to take action against attitudes toward older adults. Seventeen topics are negatively worded and 17 are positively worded, which make up an older person positive and older person negative in Alaska. The answer options are given on a 6-point total on a Likert-type scale (1 = disagree, 6 = totally agree), with a score of 4 given if the respondent does not answer the question. Higher grades show a higher negative attitude towards older adults. The Kogan operational programme scale has been used to examine the attitudes of older adults in different groups (e.g. college students, elderly adults, medical students, nursing students and other health professionals). The scale was built on a male-dominated sample and has been used for 45 years without formal review. As older adults have changed over the last 40 years due to life expectancy, health status, family makeup, living conditions and technology, a scale review is necessary. In addition, recent studies have shown that there is weak internal consistency in Alaskans and only a small proportion of dispersion. In addition, correlations between adjusted records and totals indicate that records are weakly related to a hidden variable, and in addition, the content analysis of the records has shown that some records have expired (as mentioned above). Future studies should address the inclusion of a more diverse sample in the validation of the US population scale and the study of additional forms of validity, such as predictive validity and simultaneous validity in the English-speaking population. Describe the purpose and basic characteristics of Kogan's attitudes towards old people (Kogan OP scale), including the number of objects and weights and psychometric characteristics; Describe the application of the Kogan operational programme scale in the field of health research;

assess the strengths and weaknesses of the scope of the Kogani operational programme; and provide the scale and additional materials for the Kogani op to be set up in its management.
